
(a) A null law $W(w, \varepsilon)$ (not to scale)
thin top: mass w, width ε
the upward jump pins the mode here
flat shoulder mass $p = 1 - w$
density
x
(b) The shoulder seen at scale $n^{-1/2}$
M
position in the shoulder (probability scale)
bridge b on the shoulder
greatest convex minorant
minorant to minorant $+ M$
best convex fit (minorant $+ M/2$)
